

### **Ian F Tannock MD PhD**

Professor Ian F Tannock MD (Pennsylvania) PhD (London) is the Daniel Bergsagel Professor of Medical Oncology at Princess Margaret Hospital and the University of Toronto. He is one of Canada's best-known oncologists and a major international leader in cancer research. His research work on tumour biology, cytotoxic drug administration, treatment outcome measurement and medical ethics has improved the quality of cancer care and research world-wide. He studied methods to modify drug penetration through tissue with clinically relevant strategies, and proposed a continuum of research from tissue culture models through animal experiments to clinical trials. He also introduced the use of quality of life and pain relief as effective outcome measurements in clinical trials and used these measurements to establish less toxic chemotherapy drugs as standard treatment for advanced cancers. Two of the textbooks he edited, including *The Basic Science of Oncology* and *Oxford Textbook of Oncology*, are essential reference for trainees in most oncology training centers in United States and Canada. He was the 2003 recipient of O Harold Warwick Award from Canadian Cancer Society. He currently chairs the Ethics Committee that guides the development and assures compliance of Code of Ethics for members of American Society of Clinical Oncology, the world largest oncology society.
